## Quick Start Guide

- **Important note:** Your new fruit trees come as healthy, dormant bare root plants ready to be planted in a container or ground... if you have any concerns regarding the health of the plants, please scrape a small amount of the bark away and check to ensure that the inside is green, hence good to be planted.
- For the best results leave the roots soaking in bucket of water overnight before planting
- Whether your tree is planted in a container or in the ground, the soil needs to have good drainage and you should dig in plenty of rich, organic matter and remember to water regularly, especially in warmer weather, to give your trees a good head start in life.
- For more information please refer to your free book 'Growing Fruit' included with your trees - a valuable source of information to ensure your trees get the best care and attention!
